

Taming the Boundaries

A brief introduction to Heterotic M-Theory

Why not Hořava-Witten?

What am I doing?

Conclusion

String Theories

- ▶ 5 consistent (super-)string theories
 - ▶ I, IIA, IIB, $SO(32)$ heterotic and $E_8 \times E_8$ heterotic
- ▶ Inter-related by dualities
 - ▶ eg.

Type IIA compactified on circle of radius R
 \xleftrightarrow{T}
 Type IIB compactified on circle of radius $\frac{\alpha'}{R}$

- ▶ All part of one theory?

M-Theory

- ▶ Full M-Theory is unknown
- ▶ Low energy limit is 11d supergravity¹

$$S = \frac{1}{2\kappa^2} \int \left(dvR - \frac{1}{2} G \wedge *G - \frac{1}{6} C \wedge G \wedge G + (\text{fermions}) \right)$$

- ▶ Compactification on a circle gives IIA supergravity
- ▶ Compactification on an interval gives heterotic supergravity (of which more later)

¹E. Cremmer, B. Julia, J. Scherk, Phys. Lett. B 76 (1978) 409

11d Content

- ▶ Field content is $g_{\mu\nu}$, $C_{\mu\nu\rho}$, ψ_μ
- ▶ But also 6-potential with field strength dual to $G = dC$
- ▶ p -potential couples to p -dimensional world volume
- ▶ $M2$ and $M5$ branes appear as sources for $C_{(3)}$, $C_{(6)}$

10d Content

- ▶ Compactifying gives the basic objects of the 10d string theory
 - ▶ $M2$ wrapping the circle \rightarrow string
 - ▶ $M2$ not wrapping the circle $\rightarrow D2$ brane
 - ▶ etc.

Aside on Anomalies

- ▶ Quantum anomalies²: quantum theory fails to respect classical symmetry
 - ▶ gauge symmetry: gauge anomaly ($2k$ dimensions)
 - ▶ general covariance: gravity anomaly ($4k + 2$ dimensions)
- ▶ ie. Quantum effective action varies under gauge transformations/diffeomorphisms
- ▶ Perturbatively, shows up in hexagon diagrams

²L. Alvarez-Gaumé, P. Ginsparg, Ann. Phys. 161 (1985) 423, erratum-ibid 171 (1986) 233

Heterotic M-Theory

Why not Hořava-Witten?

What am I doing?

Conclusion

Gravity Anomaly

- ▶ 11d supergravity on an interval with two 10d boundaries
- ▶ 11d supergravity is anomaly free
- ▶ But chiral gravitino on the 10d boundary gives gravity anomaly
- ▶ Cancel with E_8 vector multiplet on the boundary

Boundary Theory

- ▶ Gauge theory on the boundary:
 - ▶ Gauge field A_μ with field strength $F_{\mu\nu}$
 - ▶ Gaugino χ
- ▶ Supersymmetry of boundary determines coupling to bulk supergravity
 - ▶ In particular $G \sim F^2$ and so C acquires an E_8 gauge variation

Gauge Anomaly

- ▶ 10d super-Yang-Mills also has a gauge anomaly
- ▶ Cancelled by (classical) variation of $\int C \wedge G \wedge G$
 - ▶ fixes the gauge coupling
- ▶ The only parameter in the theory is the gravitational coupling $2\kappa^2$

A very brief introduction to M-Theory

Heterotic M-Theory

Why not Hořava-Witten?

What am I doing?

Conclusion

What's the Difference?

- ▶ Supergravity action should include boundary terms involving the extrinsic curvature, $K_{\mu\nu}$
 - ▶ These were neglected by Hořava and Witten
- ▶ Non-trivial boundary condition: $K_{\mu\nu} = \kappa^2 \left(T_{\mu\nu} - \frac{1}{9} g_{\mu\nu} T \right)$
- ▶ Super-Yang-Mills on the boundary means $T_{\mu\nu} \neq 0$ generally
- ▶ Affects the construction of the boundary conditions

Original Formulation

- ▶ Hořava and Witten³:
 - ▶ modified Bianchi identity ($dG = \dots$) involving δ -functions
 - ▶ modified supersymmetry transformations, also involving δ -functions
- ▶ Combined effect introduced divergences into the action (terms proportional to $\delta(0)$)
- ▶ Theory breaks down entirely beyond order κ^2

³P. Hořava, E. Witten, Nucl. Phys. B475 (1996) 94, hep-th/9603142

Improved Formulation

- ▶ Moss⁴:
 - ▶ Taking into account $K_{\mu\nu}$ leads to modification of the chirality condition of ψ_μ : $P_+\psi_\mu \sim F\chi$
 - ▶ supersymmetry transformations are unaltered
 - ▶ no δ -functions
- ▶ These are physically distinct theories

⁴I. Moss, Nucl. Phys. B729 (2005) 179, hep-th/0403106

Heterotic M-Theory

Why not Hořava-Witten?

What am I doing?

Conclusion

Current Work

- ▶ Working on 5d reduction of Moss's improved theory
- ▶ Are there phenomenologically important differences from work⁵ based on the Hořava-Witten version?

A very brief introduction to M-Theory

Heterotic M-Theory

Why not Hořava-Witten?

What am I doing?

Conclusion

Finally

- ▶ 11d supergravity on an interval gives Heterotic M-Theory
- ▶ Structure is fixed by supersymmetry and anomaly cancellation
- ▶ Hořava and Witten's formulation fails to treat $K_{\mu\nu}$ correctly and is led to divergences
- ▶ Moss's version treats $K_{\mu\nu}$ correctly and avoids divergences
- ▶ The consequences of the improved version for phenomenology are being investigated
